1. Introduction

1.1. Background of the Project

With the increasing demands of academic and professional life, individuals often struggle to manage their workload effectively. Micro Task Planner is a web-based productivity management system designed to help users organise and complete tasks efficiently. The system focuses on reducing procrastination by breaking large tasks into smaller, manageable subtasks called **micro tasks**.

It is specifically targeted toward students, freelancers, and working professionals who need a simple, accessible, and motivating solution for task management. Unlike complex project management tools, the system focuses on step-by-step progress tracking, making tasks easier to start and complete.

1.2. Domain Explanation

This project falls under **Productivity and Task Management Systems**, aiming to improve focus, consistency, and work completion rates through structured micro-step planning.

The proposed system is a web-based application developed using standard web technologies, including:

- **Frontend:** HTML, CSS, JavaScript
- **Backend:** PHP
- **Database:** MySQL

The system is designed to support:

- Creation and management of main tasks and micro subtasks
- Automatic progress percentage calculation and visual tracking
- User authentication and secure data management
- Productivity analytics and intelligent task recommendations

1.3. Context of the Problem

Many students and professionals face difficulties initiating and completing tasks due to the overwhelming perception of large goals. This often results in procrastination, missed deadlines, and reduced productivity. Traditional to-do lists and task managers fail to address the psychological barrier of beginning a large task.

Although several productivity applications exist, many are either too feature-heavy, require paid subscriptions, or do not emphasise micro-step planning. There is a clear need for a lightweight, motivating, and structured task breakdown system.

2. Problem Statement

Despite the availability of numerous productivity applications, many users still struggle to manage their tasks effectively. Existing systems are often too complex, feature-overloaded, or focused on team collaboration rather than individual task completion. They do not adequately address the psychological challenge of starting large tasks.

As a result, there is a need for a simple, accessible, and motivation-driven task management system that helps users break down large goals into actionable micro tasks, track progress in real time, and build consistent productivity habits.

2.1. Who is Affected

The primary stakeholders affected by this problem are:

- Students who struggle with procrastination and poor task organisation
- Freelancers managing multiple projects without structured workflows
- Working professionals overwhelmed by large workloads
- Individuals seeking to build consistent daily productivity habits

2.2. Impact

The absence of an effective micro task management system creates several negative impacts:

- Increased procrastination and failure to complete tasks
- Poor workload organisation leading to stress and burnout
- Lack of visibility into task progress and completion rates
- Difficulty maintaining motivation when facing large goals

3. Objectives

The main objective of this system is to enable users to break down large tasks into smaller, manageable micro tasks and track their progress efficiently, thereby improving productivity and reducing procrastination.

The proposed system will achieve the following specific objectives:

- To allow users to create and manage main tasks with detailed descriptions, due dates, and priority levels.
- To enable users to add subtasks (micro tasks) under each main task for step-by-step completion.
- To automatically calculate and display progress percentages as subtasks are completed.
- To provide a dynamic progress bar visualisation for each task on the dashboard.
- To offer intelligent auto-recommendation of micro tasks based on task type and history.
- To generate productivity analytics and weekly summary reports for user insights.
- To support task filtering, searching, and sorting for efficient task navigation.
- To ensure data security through user authentication and controlled access.
- To provide reminder and notification support for approaching due dates.

4. Methodology

4.1. Requirement Identification

- Studying existing productivity tools such as Todoist, TickTick, and Microsoft To-Do
- Observing common challenges faced by students and professionals in task management
- Identifying the need for a lightweight, motivation-driven, and micro-step-focused interface
- Understanding the importance of features like progress tracking, auto-recommendations, and reminders

4.2. Feasibility Study

4.2.1. Technical Feasibility

All technologies used to develop the Micro Task Planner are mature, well-documented, and freely available. The project uses standard web development technologies — HTML, CSS, JavaScript, PHP, and MySQL — which are widely used for building web applications. These technologies are well-supported by large developer communities and compatible with most web servers. The system can therefore be developed without expensive tools or specialised hardware.

4.2.2. Operational Feasibility

The system is operationally feasible because it is designed to be simple, intuitive, and user-friendly for students and professionals alike. It requires no complicated installation and can be accessed through any standard web browser. The interface follows familiar design patterns, ensuring that users can adopt the system without any formal training.

4.2.3. Economic Feasibility

The system is economically feasible since all required technologies are free and openly available. No expensive software licenses, advanced hardware, or third-party APIs are needed. Maintenance and future upgrades can be performed at minimal cost. The system thus provides an effective and affordable solution for individual productivity management.

4.3. High-Level Design

System Flow

User Input: Users create main tasks and add or receive recommended micro subtasks.

Data Processing: The system processes task data, calculates completion percentages, and organises tasks by priority and due date.

Database Storage: All task data, subtasks, and progress records are securely stored in the MySQL database.

Output Generation: The system displays results including task lists, progress bars, productivity charts, and due date alerts.

Dashboard View: Users view their full productivity overview through a clean, interactive dashboard.

Basic Architecture — Three-Tier Architecture

Tier 1: Presentation Layer (Frontend)

- HTML, CSS, and JavaScript files served to the user's browser.
- Handles UI rendering, user interaction, and form validation.
- The dashboard, progress bars, and all user-facing features reside in this layer.

Tier 2: Application Layer (Backend)

- PHP server handling RESTful API endpoints.
- Manages business logic such as progress calculation, task recommendations, and reminder triggers.
- Performs data validation before all database operations.

Tier 3: Data Layer (Database)

- MySQL database storing all persistent data including users, tasks, subtasks, and progress records.
- Queries are optimised for real-time dashboard updates and analytics generation.

5. Gantt Chart

5.1. Project Timeline

MICRO TASK PLANNER: 12-WEEK GANTT CHART

PROJECT TIMELINE & SCHEDULE

6. Expected Outcome

6.1. What The System Will Deliver

- A web-based application for creating, managing, and tracking tasks and micro subtasks
- Automatic progress percentage calculation with dynamic visual progress bars
- An intelligent micro task recommendation engine based on task category
- A comprehensive productivity analytics dashboard with charts and weekly summaries
- Due date and priority management with reminder and notification support
- Secure user authentication and personal data management

6.2. Final Result

After completion, the project will provide:

- A fully functional micro task planning system accessible through any web browser
- Easy visualisation of task progress, completion rates, and productivity trends
- Reduced procrastination and improved task completion rates among users
- A reliable platform for managing both personal and professional workloads
- A simple, motivating, and efficient solution for daily productivity management
